SECTION:1

LAB GROUP:2

Preliminary Work:

a)Read the document "An_Introduction_to_VHDL".

I read it.

b) Research into case-when, if-elsif and for loop structures in VHDL. Give a short example for each structure and explain how they work?

CASE-WHEN:

The VHDL Case Statement works exactly the way that a switch statement in C works. Given an input, the statement looks at each possible condition to find one that the input signal satisfies. They are useful to check one input signal against many combinations.

IF-ELSE IF:

An if else statement in programming is a conditional statement that runs a different set of statements depending on whether an expression is true or false. Which means it is n Boolean type statement.

FOR LOOP:

The For-Loop allows you to iterate over a fixed range of integers or enumerated items. The item belonging to the current iteration will be available within the loop through an implicitly declared constant.

c) Draw block diagram of a 3x8 decoder, obtain truth table.
